Environmental rehabilitation of Regi Lagni

The plan Environmental rehabilitation of the Regi Lagni previews the realization of the new sections maintaining in function the existing plant which will be the object of functional adaptation through the putting out of service of system parts, continuously ensuring the purification of incoming sewage. The plant has a purification capacity of about 450,000 inhabitant's equivalents. The project is carried out following the phases: re-functionalization of buildings and electromechanical sewage and sludge line, new monitoring and remote-control network, remediation works, and environmental mitigation interventions.
