## Industrial plant production of potassium salts

One of the largest reserves of lithium, potassium, boron and magnesium in the world is located in the Daniel Campos province of the Potosí Department in southwestern Bolivia. Thanks to recent preliminary studies, the Mining Corporation of Bolivia (COMIBOL), responsible for the exploitation of mineral resources in the country, has decided to carry out the design of an industrial plant in the Salar de Uyuni to obtain potassium salts, with a product quality of 95% and a production capacity of 350,000 tonnes per year. The plant went into production in 2018.
